

A SECURE, FEATURE-RICH MANAGEMENT SYSTEM

Phoenix IVS provides a complete intelligent video solution by providing software components that help to effectively manage and disseminate events detected by Phoenix IVS intelligent video sensors. IVA Enterprise centers on enabling features that advance threat detection, alert response, and streaming video capabilities presented by Phoenix IVS intelligent video devices. IVA Enterprise includes a mapping engine (VSOD™), advanced management and alert notification features, and enhances your video recording system with network video recording (NVR) and a robust data management and archiving application. IVA Enterprise is built on a client server architecture where data resides in a database server while video and archived data are stored in application and storage servers.

SOFTWARE FEATURES

Camera Control: Allows live video viewing, view camera configuration, rules and responses for each camera, enables PTZ controls from IVA console for any Pan Tilt Zoom enabled cameras.

Alert Management: Allows review of all security and system alerts, search by time, date, group, camera, system event type, security alert, acknowledgment and alert video. Displayed with camera images, map snapshot and recorded video.

Network Video Recording: Allows recording of video based on alert, user command, or schedule. Allows users to create video profiles, schedule recordings, search a video archive and playback stored and live video.

GIS Mapping: Visual Surveillance Object Display (VSOD) allows visual representation of security objects and equipment located throughout the network in multiple layers. Alerts highlight the sensor and their location within the network.

Data Management and Archiving: Allows ability to schedule archiving of the system database, files, alert and system events and video files to a network attached storage device.

SOFTWARE FEATURES

Rule Management: GUI based wizard used to set up rules which perform real-time event detection for live surveillance video. Rules tell the system which security events to look for in the video.

Response Management: Allows actions, or responses, to occur based on alert detection such as recording video upon alert for a specified time, close a relay upon an event and send a notification response via email or SMS message to a contact or a distribution list.

Group and User Management: Allows cameras and client workstations to be visually represented in groups and allows ability to create recordings via a group or send alerts related to specific cameras to a group.

IT and Data Security: Allows encryption to secure local data storage/communication, login to all applications, export and retrieval of data, password access to all fields, messaging over TCP or UDP communication and archived data sets when exported to SAS servers or NAS drives.

Camera Wall and Video Matrix: Allows the ability to simultaneously view multiple video feeds in one application and customize a view based on standard layout configurations in the system.

Reports Generator: Allows ability to search for various events, including alerts and system events then generate reports that can be exported to PDF, Word or Excel. Types of reports include Alert Report, System Event Report, User Event Report and Data Management Events Report.

Archive Viewer: Allows all data, including video and alerts, to be exported and stored to a local storage device, server attached storage or network attached storage. This data is encrypted and retrieved using the IVA Archive Client.

Client and Handheld Software: Client software that allows user determined desktop Windows PCs and Windows Mobile Handheld PDAs to display alert events along with video for predefined sensors.

Configurable System Settings: Software is highly configurable from a simple user to an administrator making Phoenix IVS software easy to use. Allows authorized users to customize the management software to individual settings.

Notification Settings: An easy to use GUI allows for simple configuration of notification settings including email servers, SMS modems and gateways and IM clients.
